

Menopause

Menstrual problems

Menopause, by nature, is intended to be a gradual reduction of estrogen by the ovaries, with few side effects. In a well-nourished, vibrant woman, the adrenals and other glands pick up the job of estrogen secretion to keep her active and attractive after menopause. Our modern, stressful lifestyles and poor eating habits today mean that many women reach their menopausal years prematurely with worn out adrenals and poor liver function, where estrogen is not being processed correctly, so hormone fluctuations are magnified.
